

Programming Question: Arrange Elements in Pairs

You are given an array of integers `arr`. Consider its elements in pairs: $(arr[0], arr[1])$, $(arr[2], arr[3])$, and so on. Arrange the elements in each pair in ascending order. In other words, swap the position of paired elements if the left element is greater than the right one.

If `arr` contains an odd number of elements, the last element should be left unchanged.

Note: You are not expected to provide the most optimal solution, but a solution with time complexity not worse than $O(arr.length^2)$ will fit within the execution time limit.

Examples

• For `arr = [1, 5, 7, 3, 2, 1]`, the output should be

`solution(arr) = [1, 5, 3, 7, 1, 2]`.

Explanation:

- The given array consists of 3 pairs: (1, 5), (7, 3), (2, 1).
- After arranging elements in each pair in ascending order, we get: (1, 5), (3, 7), (1, 2).
- So, the answer is [1, 5, 3, 7, 1, 2].

• For `arr = [6, 7, 8, 8, 5, 3, 2]`, the output should be

`solution(arr) = [6, 7, 8, 8, 3, 5, 2]`.

Explanation:

- The given array consists of 3 pairs and 1 ending element: (6, 7), (8, 8), (5, 3), and (2).
- After arranging elements in every pair in ascending order, we get: (6, 7), (8, 8), (3, 5), and (2).
- So, the answer is [6, 7, 8, 8, 3, 5, 2].
